

O SOLE MIO

THE HOUSE OF SUN

O **Sole Mio** is a wooden prefab-house, produced by Griffner Haus in Austria. It fulfills all the requirements of a low-energy house, even without employing high-tech solutions such as solar panels, etc.

O **Sole Mio** initiates a revolutionary step in the history of constructing and living. Its modular unit construction system allows various combinations of individual houses.

The special quality of O **Sole mio** is the use of wood and glass as the main construction materials. In fact, the large south-facing window facade with its wooden lamella-shutter-system provides optimal regulation of light and warmth. In exploiting natural energy sources with heat pumps and thermo recycling, O **Sole Mio** consumes only one sixth of the amount of energy a house of the same size with standard energy demands. More precisely, the energy consumption of O **Sole Mio** amounts to 54 Kwh/sq.m. (annual average).

Considering its energy saving advantages and its modular unit system, O **Sole Mio** is perfectly suitable for terrace construction. With O **Sole Mio** we are approaching our goal of optimal living.
